

## What is JWT?

A signed token (JSON Web Token) that represents a user's identity. It consists of **Header + Payload + Signature**. The **Payload is Base64-encoded**

## How does it work?

1. After login, you receive a **short-lived token**.
2. You send it with every request in the header: `Authorization: Bearer {token}`.
3. The server verifies the **signature** and **expiration** and accepts the request

The JWT always use **HTTPS**

## Structure of a JSON Web Token (JWT)
